

DC Fan

San Ace 280

9GA type

Features

Low Power Consumption

Power consumption has been reduced by approximately 12% compared with four San Ace 172W 9WE type fans (Model No. 9WE5724K501) operating in parallel to provide equivalent cooling performance.⁽¹⁾

Wide Temperature Range

The fan operates over a wide temperature range of -40°C to +70°C, making it suitable for low-temperature applications such as rapid freezers and refrigerated and freezer showcases.

Environmentally Conscious Design

The fan uses lead-free brass, complies with the RoHS Directive,⁽²⁾ and is certified as Eco Product Plus⁽³⁾ for its environmentally conscious design.

(1) Applies to Model No. 9GA2824P5G001.

(2) The RoHS (Restriction of Hazardous Substances) Directive restricts the use of certain hazardous substances in electrical and electronic equipment distributed within the European Union.

(3) Eco Products are products that reduce environmental impact compared with our existing products, or comparable products on the market when no equivalent SANYO DENKI product exists. Our products are assessed over the product's life cycle against our own eco-design requirements including product size, weight, power consumption, and CO₂ emissions, and those meeting our standards and higher standards qualify as Eco Products and Eco Products Plus, respectively.

PWM Input Signal Example

Input signal waveform

$$V_{IH} = 4.75 \text{ to } 5.25 \text{ V} \quad V_{IL} = 0 \text{ to } 0.4 \text{ V}$$

$$\text{PWM duty cycle (\%)} = \frac{T_1}{T} \times 100 \quad \text{PWM frequency } 25 \text{ (kHz)} = \frac{1}{T}$$

Current source (I_{source}) = 1.0 mA max. (when control voltage is 0 V)

Current sink (I_{sink}) = 1.0 mA max. (when control voltage is 5.25 V)

When the PWM control terminal is open, the fan speed is the same as the speed at 100% PWM duty cycle.

The PWM signal can be used with open collector or drain input.

Note that when using an open collector or drain input, or inputting a different voltage or frequency, the speed relative to the PWM duty cycle may differ from this specification.

The switching inside the fan may affect the control terminal voltage.

In case of steady running

$$T_{1 \text{ to } 4} \doteq (1/4) T_0$$

$$T_{1 \text{ to } 4} \doteq (1/4) T_0 = 60/4N \text{ (s)}$$

$$N = \text{Fan speed (min}^{-1}\text{)}$$
